Solutions for Logistics & Transportation

Streamline Shipping Paperwork with ABBYY Data Capture

Stop retyping the data from paper—extract it automatically. Even though today's transportation and logistics industry has globalized and adopted technologies for many purposes, it still relies heavily on such paper documents as Bills of Lading, Delivery Receipts, Commercial Invoices, cargo manifest, Claims forms etc. to convey information. At various stages of the supply chain, these documents are typically printed out and then manually keyed in to another electronic system. Unfortunately, this manual data entry translates into information delays, human errors and hours of redundant labor.

Automated Data Capture

ABBYY® technological solutions helps in faster and more accurate information flows to both internal and external customers. ABBYY solutions help transportation and logistics companies, customs brokers, terminal operators and other members of the supply chain in increasing efficiency with built-in features that automatically classify documents, extract business-ready quality data, and reduce the need for manual intervention.

ABBYY Solutions for Logistics & Transportation

ABBYY solutions help in data extraction for transforming documents of any structure, language and content into usable and accessible business-ready data automatically. Help streamlining and simplifying most paper-intensive transportation and logistics business workflow.

ABBYY Mobile solution helps to capture and submit a Delivery Receipt or Bill of Lading at the field level.Capturing and extracting key data of Delivery Receipt to provide both the shipper and receiver a copy of the Delivery Receipt in real time.

Speedy processing of customs forms

Customs Brokerage has historically been based on paper documents, from which the necessary tariff and product information is extracted for every line item in the shipment. The extracted data is then manually keyed in to electronic systems to be transmitted in most cases electronically to Customs. Manual data entry is time-consuming and prone to human errors.

We helps automating the classification and advanced data capturing of Customs documents. Bill of Lading line items, Certificates of Origin and Commercial Invoices can be automatically classified and the relevant data are extracted and exported to existing electronic systems. The extracted data can be validated against databases and business rules to ensure the integrity of the data and allows operators to deal only with exceptions.

Increase efficiency of accounts payable. Paper is still a common format for invoices in Transportation and Logistics. Processing paper invoices not only requires entering invoice data but also matching to other documents to confirm and approve invoice contents. ABBYY solutions help invoice processing and organization to realize benefits in accounts payable such as paying invoices accurately, maintaining good relationship with suppliers.
